

# Our Lumber

## Treated Wood Just Got Greener

We use only hand selected #1 grade pressure-treated southern yellow pine. Our lumber is kiln dried before and after MicroPro treatment for a dry product. MicroPro technology is a revolutionary way to treat wood. MicroPro pressure treatment uses micronized copper preservatives, which help protect against termite damage and fungal decay.

Following an exhaustive study by Scientific Certification Systems (SCS), a leader in green-building product certification since 1990, the MicroPro wood preservative process has received the coveted **Environmentally Preferable Product** (EPP) certification based on Life Cycle Assessment.

## The Most Responsible Choice...

Isn't it nice to know that you're getting not only the very best protection against rot, fungal decay and termite attack, but also a responsible product treated with a preservative that is SCS certified as an Environmentally Preferable Product?

## Born & Raised in the USA

This lumber is produced in mills located in the USA and is drawn from forests managed in compliance with SFI or SCI managed forest products.

SFI is an independent organization made up of representative members from environmental, conservation, professional and academic groups, independent loggers, small family forest owners, public officials, labor and the forest products industry that promote sustainable forest management across North America.
